Photo Mug & Photo Calendar — Implementation Plan

Scope: Two new configurable products for the existing shop — Photo Mug and Photo Calendar (6 calendar types) **Platform:** Existing shop app — Django / PostgreSQL backend, React frontend

1. Summary

We're adding two configurable, made-to-order photo products to the shop: a **Photo Mug** and a **Photo Calendar** family covering 6 calendar types. Both follow the pattern already used elsewhere in the shop — the customer configures the product, picks image(s), sees a live preview, and adds it to the basket. Below is what each product includes, how it will work.

---

2. Photo Mug

2.1 Configuration flow

1. Choose a style — **Panoramic** (one image wraps fully around the mug) or **Partial** (image sits on one section of the mug, positioned **left** or **right**)
2. Choose the **rim & handle color**
3. Choose the **inner color**
4. Select 1 photo
5. Position/crop the photo
6. **Live preview** of the finished mug
7. Add to basket

2.2 Live preview approach

the live preview uses a **flat, unwrapped mug template** mockup:

- Each style (Panoramic, Partial-left, Partial-right) has its own flat print-area template defining where the photo sits
- The customer's cropped photo is placed directly into that flat area
- Rim/handle color and inner color are **not rendered visually** in the preview. With rim/handle colors and inner colors, producing an accurate mockup for every combination isn't practical for this phase — instead, the selected colors are shown to the customer as labeled swatches, and sent to the backend as data alongside the image and crop coordinates

2.3 Data & backend

- Style, rim/handle color, and inner color become selectable configuration options on the product (same option pattern already used for other configurable products in the shop)
- Each order stores: style, rim/handle color, inner color, image, crop data
- No print-vendor template has been provided yet, so print-file generation will use one **generic flat mug template** for both Panoramic and Partial (left/right) for now.
- Integrate the Allcop.

---

3. Photo Calendar

3.1 Calendar types, formats & paper

Six calendar types, each with its own supported formats and paper options:

Product	Format	Matt	Glossy (Hochglanz veredelt)	Recycling paper
Digital printed calendar	20×20	✓	✓	✓
	30×30	✓	✓	✓
	A4 portrait	✓	✓	✓
	A4 landscape	✓	✓	✓
	A3 portrait	✓	✓	✓
	A3 landscape	✓	✓	✓
Appointment (wall) calendar	A4 portrait	✓	—	✓
	A3 portrait	✓	—	✓
Family calendar	A4 portrait	✓	—	✓
	A3 portrait	✓	—	✓
Clipboard calendar	A4 portrait	✓	—	✓
Wooden-base (table) calendar	15×15, wooden base + back print	✓	—	✓
	15×15, no wooden base + back print	✓	—	✓
	15×15, wooden base, no back print	✓	—	—
Kitchen calendar	13×30	✓	—	✓

Appointment calendar = a wall-calendar layout with a larger writing area (not per-day personal notes/events).
This matrix drives which format/paper combinations are shown and purchasable for each calendar type.

3.2 Structure — 13 pages

Every calendar, regardless of type, has **13 pages: 1 cover + 12 month pages**.

3.3 Templates & layouts

- The cover and each month page can use a different **layout template** — a single full image, or a multi-image collage (2, 3, 4+ photos arranged in a grid or asymmetric layout)
- This extends the page-layout/template engine already built for the shop's photobook product, adapted for calendar pages (leaving room for the date grid and, on relevant types, the appointment column)
- Each month page combines: image area (per chosen layout) + date grid + optional custom text

3.4 Year, holiday region & date grid

- Customer selects the **year**
- Customer selects a **holiday region** — public holidays for that region are marked on the date grid
- Holiday regions need per-state (Bundesland) granularity long-term. For now, holiday data will be **placeholder/dummy data**; the admin will be able to manage and correct real per-state holiday data.
- The date grid (day numbers, weekdays, holidays) is generated dynamically from the selected year and region
- **Currently it will support the horizontal date-grid layout only**; other grid orientations are out of scope for now.
- Language/locale (month & weekday names, first day of week) stays **German-only**

3.5 Fonts & text styling

- Customer can choose from the shop's existing font library and apply text styling (size, weight, alignment) to text on the calendar
- Extends the text-styling system already built for the photobook product

3.6 Live preview

The customer sees the calendar page render live while configuring — image layout, date grid, fonts, and text all update in real time, matching the live-preview pattern already used elsewhere in the shop.

3.7 Data & backend

- `CalendarType → format → paper` compatibility matrix (matching the table above), driving available options and pricing

- Per-order calendar configuration: year, holiday region, and per-page data (selected layout, assigned image(s), text, font)
- Holiday data stored per region/year (dummy data for now, admin-editable afterward) and baked into the date grid at preview and export time
- Print-ready file generation for all 13 pages, per selected format and paper — **bleed/safe-zone differs per format/paper** per the print vendor.
- Integrate the Allcop.

---

4. Confirmed decisions

- **Holiday regions:** per-state (Bundesland) support is needed long-term; for now we ship with dummy/placeholder holiday data, later the admin can update it.
- **Mug colors:** rim/handle colors and inner colors (multiple combinations). Colors are **not rendered in the live preview** — they're captured as selected data and sent to the backend with the image and crop coordinates
- **Mug print template:** no vendor template provided yet — a **generic flat mug template** will be used for both Panoramic and Partial styles for now
- **Mug live preview:** shows the **flat, unwrapped** template with the photo placed on it with different available types (Panoramic, Partial).
- **Appointment calendar:** a wall-calendar layout with a larger writing area — not per-day personal notes/events
- **Calendar bleed/safe-zone:** confirmed to differ per format/paper based on specifications provided by vendor.
- **Language/locale:** German-only
